DETAILED ACTION

Claim Rejections - 35 USC § 101

1. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Claim 22 is rejected under 35 U.S.C. 101 because the claimed invention is directed to non-statutory subject matter. The claim recites "A computer program embodied in a computer readable storage medium" After close inspection, the examiner respectfully notes that the disclosure, as a whole, does not specifically identify what may be included as a computer readable storage medium and what is not to be included as a computer readable storage medium. An examiner is obliged to give claims their broadest reasonable interpretation consistent with the specification during examination. The broadest reasonable interpretation of a claim drawn to a computer readable storage medium (also called machine readable medium and other such variations) typically covers forms of non-transitory tangible media and transitory propagating signals per se in view of the ordinary and customary meaning of computer readable media, particularly when the specification is silent. See MPEP 2111.01. When the broadest reasonable interpretation of a claim covers a signal, per se, the claim must be rejected under 35 U.S.C. § 101 as covering non-statutory subject matter. Therefore, given the silence of the disclosure and the broadest reasonable interpretation, the computer readable storage medium of the claim may include transitory propagating signals. As a result, the claim pertains to non-statutory subject matter.

However, the Examiner respectfully submits a claim drawn to such a computer readable storage medium that covers both transitory and non-transitory embodiments may be amended to narrow the claim to cover only statutory embodiments to avoid a rejection under 35 U.S.C. § 101 by adding the limitation "non-transitory" to the claim. Such an amendment would typically not raise the issue of new matter, even when the specification is silent because the broadest reasonable interpretation relies on the ordinary and customary meaning that includes signals *per se*. For additional information, please see the Patents' Official Gazette notice published February 23, 2010 (1351 OG 212).

Claim Rejections - 35 USC § 102

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

3. Claims 1, 3-14, 16-25, 29 and 31-33 are rejected under 35 U.S.C. 102(e) as being anticipated by Brown et al. (US 7,046,687).

Regarding claim 1, 11, 22 and 23, Brown teaches a method of allocating queues in a network device, the method comprising: receiving a packet at an ingress port 1102 of a network device, wherein the ingress port has a plurality of virtual queues 1110 (Column 22 Line 31-45); making a classification for the packet according to a virtual

queue from said plurality of virtual queues (Brown teaches classifying based on destination port address and priority level in Column 24 Line 1-19, also see Figure 11B), the virtual gueue 1110 configured to hold a collection of information in a particular order, including information associated with the packet (Column 22 Line 31-45); determining, by searching a memory of allocated physical queues, whether a previously- allocated physical queue exists for the classification ("locates an entry .. that has the same destination address and priority level" in Column 36 Line 52-55, see also step 1802 in Figure 18); allocating a physical queue for the classification when no previouslyallocated physical queue exists for the classification ("If there is no entry, i.e., no active VOQ, with the same destination address ... creates a new entry" in Column 36 Line 57-61, see also step 1802 in Figure 18); associating the physical gueue with the ingress port (iVOQs 1110 is associated with iReveiver 1102, see Figure 11A); storing said information associated with the packet in the allocated physical queue (step 1802-step 1806); and scheduling the packet for transmission between the ingress port and one of a plurality of egress ports of the network device (Column 23 Line 30-33, see also Figure 19).

Regarding claim 3 and 13, Brown teaches the virtual queue is a virtual output queue 1110.

Regarding claim 4 and 14, Brown teaches detecting when a previously-allocated physical queue is empty; and de-allocating the empty previously-allocated physical queue (Column 36 Line 61-44, also see Column 27 Line 43-46).

Regarding claim 5 and 12, Brown teaches the virtual queue is associated with an ingress port (iVOQs 1110 is associated with iReveiver 1102, see Figure 11A).

Regarding claim 6 and 16, Brown teaches the classification is based on one or more of a packet source, a packet destination, an ingress port number, an egress port number, or a packet priority (Column 24 Line 1-19, also see Figure 11B).

Regarding claim 7 and 17, Brown teaches the classification comprises a priority number (priority level in Column 36 Line 57).

Regarding claim 8 and 18, Brown teaches the determining step comprises addressing the memory of allocated physical queues in a single cycle (Brown teaches using CAM 1402 and its contents can be searched in one cycle, see instant specification Page 16 Line 16-17).

Regarding claim 9 and 19, Brown teaches updating a memory when a physical queue is de-allocated, wherein the memory indicates whether the classification corresponds to the previously-allocated physical queue (Column 36 Line 61-44, also see Column 27 Line 43-46).

Regarding claim 10, 20 and 21, Brown teaches the network device further comprises a free list that indicates physical queues available for allocation and wherein the method further comprises updating the free list when the previously-allocated physical queue is de-allocated (Column 27 Line 8-31, see also Figure 11C).

Regarding claim 24, Brown teaches the content addressable memory is searchable in one clock cycle (Brown teaches using CAM 1402 and its contents can be searched in one cycle, see instant specification Page 16 Line 16-17).

Regarding claim 25, Brown teaches the memory is a random access memory 1401.

Regarding claim 29, Brown teaches determining a first number of packets that the ingress port of the network device can receive (1024 for example in Column 36 Line 17-24); and allocating a second number of physical queues for the ingress port, wherein the second number is less than or equal to the first number (256 for example in Column 36 Line 25-33).

Regarding claim 31, Brown teaches identifying a category for each packet arriving at the ingress port (Column 24 Line 1-19, also see Figure 11B and "locates an entry .. that has the same destination address and priority level" in Column 36 Line 52-55, see also step 1802 in Figure 18); correlating the category to an existing physical queue (Column 36 Line 55-57); and storing packet information in the existing physical queue (step 1802-step 1806).

Regarding claim 32, Brown teaches identifying a category for each packet arriving at the ingress port (Column 24 Line 1-19, also see Figure 11B and "locates an entry .. that has the same destination address and priority level" in Column 36 Line 52-55, see also step 1802 in Figure 18); and assigning the category to a physical queue, wherein the network device allocates a new physical queue only when there is no existing physical queue for the category ("If there is no entry, i.e., no active VOQ, with the same destination address ... creates a new entry" in Column 36 Line 57-61, see also step 1802 in Figure 18).

Regarding claim 33, Brown teaches the packet information comprises control information selected from a list consisting of destination information, source information, priority information, payload type information and payload size information (step 1802-step 1806).

4. Claim 30 is rejected under 35 U.S.C. 103(a) as being unpatentable over Brown et al. in view of Ciancaglini et al. (US Pub. 2005/0089054).

Regarding claim 30, Brown teaches a method of allocating gueues in a network device, the method comprising: receiving a packet at an ingress port 1102 of a network device, wherein the ingress port has a plurality of virtual queues 1110 (Column 22 Line 31-45); making a classification for the packet according to a virtual queue from said plurality of virtual gueues (Brown teaches classifying based on destination port address and priority level in Column 24 Line 1-19, also see Figure 11B), the virtual queue 1110 configured to hold a collection of information in a particular order, including information associated with the packet (Column 22 Line 31-45); determining, by searching a memory of allocated physical queues, whether a previously- allocated physical queue exists for the classification ("locates an entry .. that has the same destination address and priority level" in Column 36 Line 52-55, see also step 1802 in Figure 18); allocating a physical queue for the classification when no previously-allocated physical queue exists for the classification ("If there is no entry, i.e., no active VOQ, with the same destination address ... creates a new entry" in Column 36 Line 57-61, see also step 1802 in Figure 18); associating the physical queue with the ingress port (iVOQs 1110 is associated with iReveiver 1102, see Figure 11A); storing said information associated

Application/Control Number: 10/648,624

Page 8

Art Unit: 2464

with the packet in the allocated physical queue (step 1802-step 1806); and scheduling the packet for transmission between the ingress port and one of a plurality of egress ports of the network device (Column 23 Line 30-33, see also Figure 19). Brown also teaches determining a first number of packets that the ingress port of the network device can receive (1024 for example in Column 36 Line 17-24); and allocating a second number of physical queues for the ingress port, wherein the second number is less than or equal to the first number (256 for example in Column 36 Line 25-33). Brown, however, does not teach the network device operates according to a Fibre Channel protocol and wherein the determining step is based on a number of buffer-tobuffer credits granted by the ingress port. Ciancaglini teaches the network device operates according to a Fibre Channel protocol [0132] and wherein the determining step is based on a number of buffer-to-buffer credits granted by the ingress port [0132]. It would have been obvious to one skilled in the art to modify Brown to be with the network device operates according to a Fibre Channel protocol and wherein the determining step is based on a number of buffer-to-buffer credits granted by the ingress port as taught by Ciancaglini in order to provide efficient and reliable data transport in storage environment [0011].

Response to Arguments

5. Applicant's arguments with respect to claims 1, 3-14, 16-25 and 29-33 have been considered but are most in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to CLEMENCE HAN whose telephone number is (571)272-3158. The examiner can normally be reached on Monday-Friday 8-4.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ricky Ngo can be reached on (571) 272-3139. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
